

Pinhole leaks were popping up for the past five years. Then we learned about epoxy lining.

“We decided we had to replace all the pipes or find out if there might be another solution. We heard about lining the pipes with epoxy, and chose CuraFlo after considering one other company.”
Katherine Reis, San Diego CA

Problem:

“Pinhole leaks were popping up all over,” says Katherine Reis, owner of the Louisiana Street Apartments in San Diego’s Midtown area. The 24-unit complex was built in the 1970s. In the past five years numerous slab and wall leaks had occurred. Locating and fixing the leaks and repairing the damage had been time-consuming, intrusive and expensive.

“We decided we had to replace all the pipes or find out if there might be another solution,” recalls Reis. “We heard about lining the pipes with epoxy, and chose CuraFlo after considering one other company.”

Solution:

Brinks CuraFlo applied its exclusive “stop leak” formula to solve the problems at the Louisiana Street Apartments. Brinks technicians performed a diagnostic review of the water delivery system, completed a valve system upgrade, and then cleaned the interior of the pipes with a pressurized abrasive airflow, removing hard water deposits, scale and corrosion.

Next, the Brinks team applied a tough epoxy lining (Curapoxy) – literally a corrosion-resistant “pipe within a pipe.” The exclusive Curapoxy lining hardens in 45 minutes and allows full restoration of water service in as little as 5 hours. All without the inconvenience of the major demolition of walls and floors, repair work and lengthy cleanup work that Reis’ tenants had experienced. Plus a 15-year internal and external warranty.

“Brinks CuraFlo did a wonderful job,” Reis said. “Their workers were good with our tenants, kept them informed and did not interfere much.”

Brinks CuraFlo...your best choice in Epoxy Pipe Linings
